## Abstract

In the latest stable version of Scilab-5.5.2, there is no way to distinguish between various Tk Source windows that open up on simulation. This document describes the way to add the New Tkscale block containing the improved functionalities.

**Keywords**—*interfacing; computational; utility function*

## I. INTRODUCTION

Scilab [1] is free and open source software for numerical computation providing a powerful computing environment for engineering and scientific applications. In particular, Scilab provides users with standard palettes and blocks to design hybrid dynamical systems models. However, the current implementation of TKSCALE block does not contain the way by which the various Tk Source windows can be distinguished.

In this work, I present a New-TKSCALE block which not only distinguishes the various Tk Source windows but also provides user the ability to name the Tk Source windows as per their convenience. The TKSCALE block is comprised of two functions namely interfacing function and computational function. These functions are modified along with other files to improve the current version (scilab-5.5.2) of TKSCALE block.

## II. CREATING A SCICOS BLOCK

Each Scicos block [2] is defined by two functions. The first one is the interfacing function, it is written in Scilab and it defines the geometry of the block (input, outputs, Icon, size, shape). It is also the function that handle the user interface (parameters, states,...). The second function is the computational function which defines the behaviour of the block during the simulation phase.

### A. Interfacing function

The interfacing function of new TKSCALE is to be added at `SCI/modules/scicos_blocks/macros/Sources/NEW_TKSCALE.sci`. To add the label field to block parameters so as to distinguish various Tk Sources, I provided a field “**Name of TKSCALE**” of type “**str**”, 1 in the `scicos_getvalue()` [3] function. Figure 1. shows the corresponding code of NEW\_TKSCALE.sci. Also, inside the “*define*” case, use the *exprs* to pass the vector of strings including formal expressions as shown in Figure 2.

### B. Computational function

The computational function of new TKSCALE is to be added at `SCI/modules/scicos_blocks/macros/Sources/new_tkscaleblk.sci`. The various Tk Source windows can be distinguished if they are labeled as 1,2,3,...,n. So, to get the current block number I used the utility functions [4] provided by Scilab namely `curblock()` [5]. This function returns the current called `xcos` block during simulation. The changes done in the `new_tkscaleblk.sci` file are shown in Figure 3. Also use the variable *labelling* to get the default label of Tk Source windows. Variable *label\_new* initially contains the sentinel value and is used to get the label entered by the user. The corresponding code is shown in Figure 4.

## III. CHANGING SOURCES.COSF FILE

Sources.cosf file contains the default values for the block parameters and is present at the location `SCI/modules/scicos/palettes/Sources.cosf`. I included the lines of code for new TKSCALE block in this file as shown in Figure 5.

FIGURE 5: ADDING CODE FOR NEW TKSCALE BLOCK IN SOURCES.COSF

#### IV. ADD NEW\_TKSCALE.PNG

The NEW\_TKSCALE.png is the image which is reflected on the palettes browser. It needs to be added at the location *SCI/modules/xcos/images/palettes/NEW\_TKSCALE.png*.

#### V. CHANGE PALETTES.XML FILE

The palettes.xml file present at the location *SCI/modules/xcos/etc/palettes.xml* is used for internal storage of the standard blocks and palettes. So, modify the file to contain the entry for the new TKSCALE block as shown below:

```

<block name="NEW_TKSCALE">
  <icon variable="SCI"
  path="/modules/xcos/images/palettes/NEW_TKSCALE.png">
</block>

```

#### VI. CHANGE XCOS-STYLE.XML FILE

The Xcos-style.xml file present at the location *SCI/modules/xcos/etc/Xcos-style.xml* is used to display the block with label when block is used in the diagram. So, modify the file to contain the entry for the new TKSCALE block as shown below:

```

<add as="NEW_TKSCALE" extend="blockWithLabel">
  <add as="displayedLabel" value="NTkScale">
</add>

```

#### VII. CONCLUSION

The NEW TKSCALE block has been successfully added to the standard palette browser as shown in Figure 6 by following the above steps and is ready for future use.

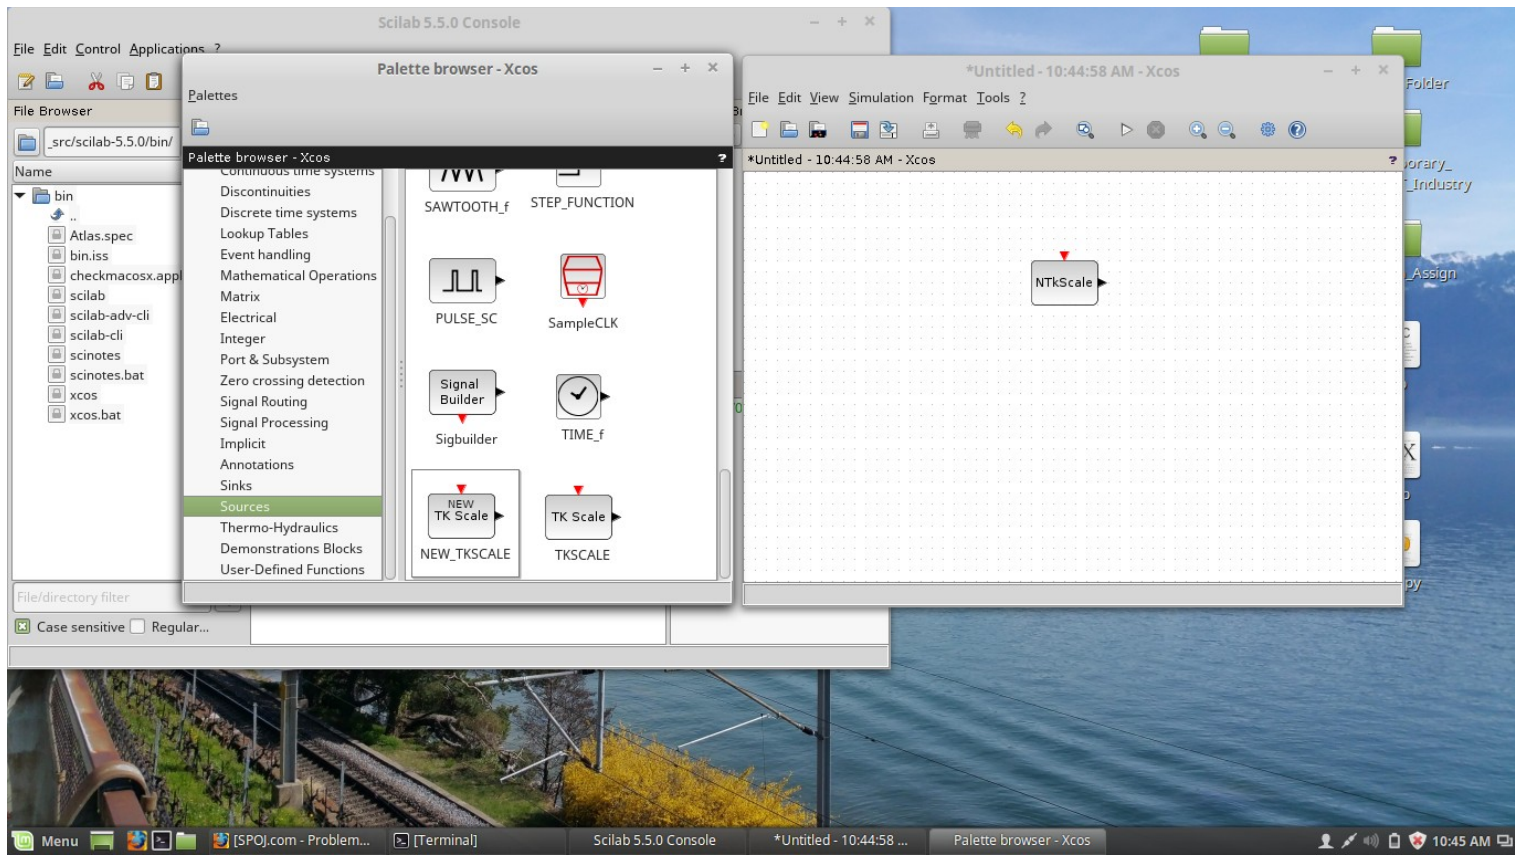

FIGURE 6: NEW TKSCALE BLOCK ADDED TO PALETTE BROWSER

#### ACKNOWLEDGMENT

I would like to thank Prof. Kannan Moudgalya, Miss. Inderpreet Arora and Miss. Dipti Ghosalkar for their valuable comments and suggestions in completing the work.
